### **INSTRUCTION MANUAL**

This Instruction manual is intended to acquaint  
the B.S.A. owner with details of the controls,  
general maintenance and technical data which  
may be required for normal operation of the  
machine.

It does not contain the information necessary  
to carry out complete stripping for major  
overhauls, but if any owner feels competent to  
carry out this type of work, a service manual and  
an illustrated spares catalogue for this machine  
can be obtained from his B.S.A. spares stockist  
or local dealer.

Owners in the British Isles can obtain these  
publications direct from B.S.A. Motor Cycles  
Ltd., Service Department, Armoury Road,  
Birmingham 11. Always quote full engine and  
frame numbers when ordering these  
publications.

## TECHNICAL DATA

Carburation: Amal

Bore ..... in.

Main jet ..... 140

Pilot jet ..... 25

Throttle valve ..... 375/3 $\frac{1}{2}$

Needle position ..... 2

Needle jet ..... 1055

General Details:

Overall length ..... 79 in.

Wheelbase ..... 51 in.

Ground clearance .....  $5\frac{1}{2}$  in.

Seat height ..... 31 in.

Overall height ..... 36 in.

Handlebar width .....  $27\frac{3}{4}$  in.

The recommended tyre pressures are based on a rider's weight of 140 lbs. If the rider is heavier, increase the pressures as follows:

Front tyre: Add one lb. per sq. in. for every 28 lb. Increase above 140 lb.

# **BL Motorcycles Ltd**

*Professional Workshop Manual - English Translation*

Rear tyre: Add one lb. Per sq. in. for every 14 lb. Increase above 140 lb.

If additional load is carried in the form of a pillion passenger or luggage, the actual load bearing upon each tyre should be determined and the pressures increased in accordance with the Dunlop Load and Pressure Schedule.

6

## **TAKING OVER THE MACHINE**

Before running the machine make sure that the fuel tank contains the correct mixture of oil and petrol, that the gearbox is properly topped up with oil and that the battery is filled and charged. (See appropriate chapters for filling instructions). Normally these preparations will be carried out by the dealer who is selling the machine and the new owner has only to arrange the controls to his liking and the machine is ready for the road.

### **The Controls**

The new rider should make sure that he is quite familiar with all the controls before attempting to ride the machine. Most of the controls are adjustable and should be positioned so that they can be reached without moving the hands from the grips or the feet from the footrests. Handlebars should be adjusted so that a comfortable and natural riding position is achieved. Make sure that the bolts retaining the handlebar clamps are tight after completing any adjustment. Badly positioned controls cause poor control of the machine and will bring discomfort on long journeys.

### **Handlebar Controls**

Twist Grip. Mounted on the right handlebar it controls the throttle opening and consequently the engine speed. To open the throttle (i.e. to increase the engine speed) turn the grip so that the top moves towards the rider. Excess slackness in the cable can be removed by means of an adjuster incorporated in the cable at the carburetter end.

The rotary stiffness of the twist grip can be varied by means of the adjuster screw and locknut. It is set for average requirements when leaving the factory, but can be readjusted to suit individual preference.

Front Brake. Lever mounted on the right handlebar in front of the throttle control. Grip the lever gently to operate the brake.

Clutch. The lever is mounted on the left handlebar. Grip the lever to free the clutch, i.e. to disengage the drive between the engine and the rear wheel.

Horn. The horn button is mounted on the left handlebar and is incorporated in the headlight dipper switch.

Headlight Dipper Switch. Controls the switching from main to dipped headlight beams and is mounted on the left handlebar.

### **Other Hand Controls**

Air Control (Carburetter). This is operated by the spring loaded plunger above

# BL Motorcycles Ltd

*Professional Workshop Manual - English Translation*

the carburetter. Depress to give a rich mixture for starting purposes, raising immediately afterwards.(Important see carburetter air control, page 19).

Petrol Taps. Under the rear end of the tank. To turn on the petrol, pull out the serrated button and lock in position by turning anti-clockwise. To turn off the petrol, reverse this procedure. Both taps communicate with the main supply in the tank but if one tap is used, a reserve supply is left which can be fed to the carburetter only when the second tap is turned on. One tap only is fitted to the Silver Bantam.

Headlight Switch. This is operated by a switch on the headlamp, and has three positions OFF, LOW (L), and HEAD (H) respectively. The low position is for use when the machine is stationary.

7

Ignition Switch. This is mounted on the top of the headlamp and has three positions. With the pointer straight ahead, the ignition is switched off, and the switch should always be retained in this position when the engine is stationary, otherwise after several hours (say, over-night) the battery may become discharged. For normal starting, rotate the switch until the position marked I is straight ahead. For emergency starting with a discharged battery, rotate the switch until position E is straight ahead. (Important See Electrical Equipment).

Carburetter Tickler. This is a small plunger in the top of the carburetter float chamber on the left hand side. Pressing it down pushes down the float and frees the needle valve thus permitting the carburetter to receive excess petrol.

Steering Lock. Provision is made for locking the steering. Turn the forks to the left, when the hole in a special frame lug will coincide with the corresponding hole in the bottom yoke lug. Locking the two lugs together by means of a padlock, prevents the machine from being driven or wheeled away.

## Foot Controls

Rear Brake. On the left-hand side of the machine controls the rear brake only.

Gear-change Pedal. On the right-hand side of the engine there are two pedals one of which projects forward, this being the gearchange pedal. It affects the change from one gear to another. The lever is of the positive stop type and returns to the central position after each change. Upward movement of the lever selects the next higher gear, downward a lower gear. Neutral is between first and second gear.

Starter Pedal. This is the other pedal on the right-hand side of the engine.

Depression of the pedal rotates the engine.

## Instruments

Speedometer. This is mounted centrally
